

1. Router with parameters

Step 1: Adding dynamic parameters, same like vue.js, **:id**

```
<Route path="/jobs/:id" element={<JobPage></JobPage>} />
```

Step 2: Receiving params in the jsx file,

```
import { useParams } from "react-router-dom";
```

Then,

```
const { id } = useParams();
```

Full code snippet example,

```
import React from "react";
import { useParams } from "react-router-dom";

const JobPage = () => {
  const { id } = useParams();

  return <div>JobPage {id}</div>;
};

export default JobPage;
```
